There are several known approaches to determining the need for a new, larger or upgraded computer system, and in particular a computer system with increased storage capacity and/or processing power, in the home. The first scenario is where a buyer of a computer system comes from a market segment where there is already a proliferation of computers and storage devices and where prices are falling. For example, computer systems with a floppy drive became prevalent during the late 1970s and early 1980s, and computer systems with a hard drive during the 1990s. Today, the number of computers having a floppy drive are of the order of 80% of the total number of desktop computers sold. There are several reasons for this. First, as the price of personal computers and of floppy diskettes came down, it became possible for first time to buy computers that are too big for a household but are otherwise of high quality and comparable with personal computers of the previous era. Second, the capacity of floppy diskettes was sufficient to provide easy access to all of the files that a user needed, even if a large number of those files needed to be replaced when the older files became too old to be opened by the newer versions of various programs. There are several sources of technical progress that have led to an ever decreasing price-performance ratio of computers; for example, the development of very high capacity hard disk drives, the development of smaller, faster microprocessors, the development of integrated circuits that provide for a data bus of wider bandwidth, as well as the Moore's law of shrinking dimensions leading to faster processing speeds per unit of size. With the advent of the internet, and particularly its capacity to stream data, and its capacity to download large quantities of data over an internet connection has increased dramatically, and so has the amount of data that can be stored in a personal computer. Also, the price performance of computers has fallen since the days when a personal computer was a large and expensive item with a monitor, a computer, a keyboard, a mouse and a central processing unit, with storage capacity in the order of a few gigabytes, and a mass storage device for a large number of floppy diskettes.
